

PL/SQL : INTRODUCTION

PL/SQL

- PL/SQL is Oracle's *procedural* language extension to SQL, the non-procedural relational database language.
- With PL/SQL, you can use SQL statements to manipulate ORACLE data and the *flow* of control statements to process the data. Moreover, you can declare constants and variables, define subprograms (procedures and functions), and trap runtime errors. Thus, PL/SQL combines the data manipulating power of SQL with the data processing power of procedural languages.

PL/SQL

- Many Oracle applications are built using client-server architecture. The Oracle database resides on the server.
- The program that makes requests against this database resides on the client machine.
- This program can be written in C, Java, or PL/SQL.
- While PL/SQL is just like any other programming language, it has syntax and rules that determine how programming statements work together. It is important for you to realize that PL/SQL is not a stand-alone programming language.
- PL/SQL is a part of the Oracle RDBMS, and it can reside in two environments, the client and the server.

PL/SQL

- As a result, it is very easy to move PL/SQL modules between server-side and client-side applications.
- When the PL/SQL engine is located on the server, the whole PL/SQL block is passed to the PL/SQL engine on the Oracle server.
- The PL/SQL engine processes the block according to the Figure 2.1.

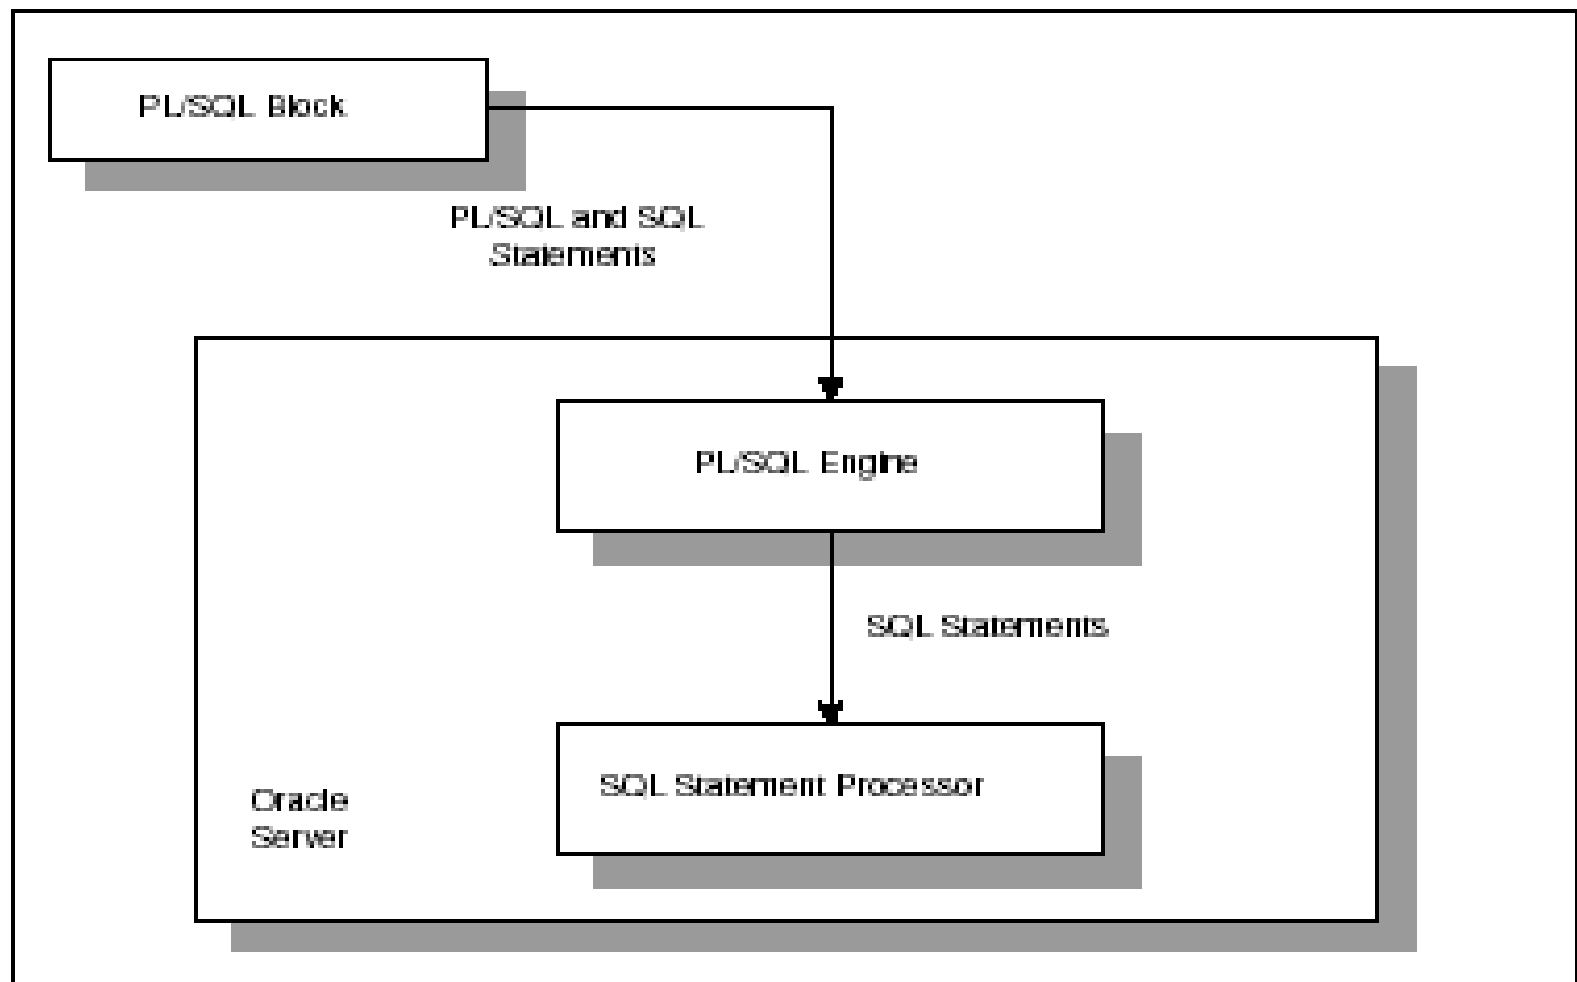

Figure 2.1 ■ The PL/SQL engine and Oracle server.

PL/SQL

- When the PL/SQL engine is located on the client, as it is in the Oracle Developer Tools, the PL/SQL processing is done on the client side.
- All SQL statements that are embedded within the PL/SQL block are sent to the Oracle server for further processing. When PL/SQL block contains no SQL statement, the entire block is executed on the client side.

DIFFERENCE BETWEEN PL/SQL AND SQL

- When a SQL statement is issued on the client computer, the request is made to the database on the server, and the result set is sent back to the client.
- As a result, a single SQL statement causes two trips on the network. If multiple SELECT statements are issued, the network traffic increase significantly very fast. For example, four SELECT statements cause eight network trips.
- If these statements are part of the PL/SQL block, they are sent to the server as a single unit. The SQL statements in this PL/SQL program are executed at the server and the result set is sent back as a single unit. There is still only one network trip made as is in case of a single SELECT statement.

Comparison of SQL*PLUS and PL/SQL

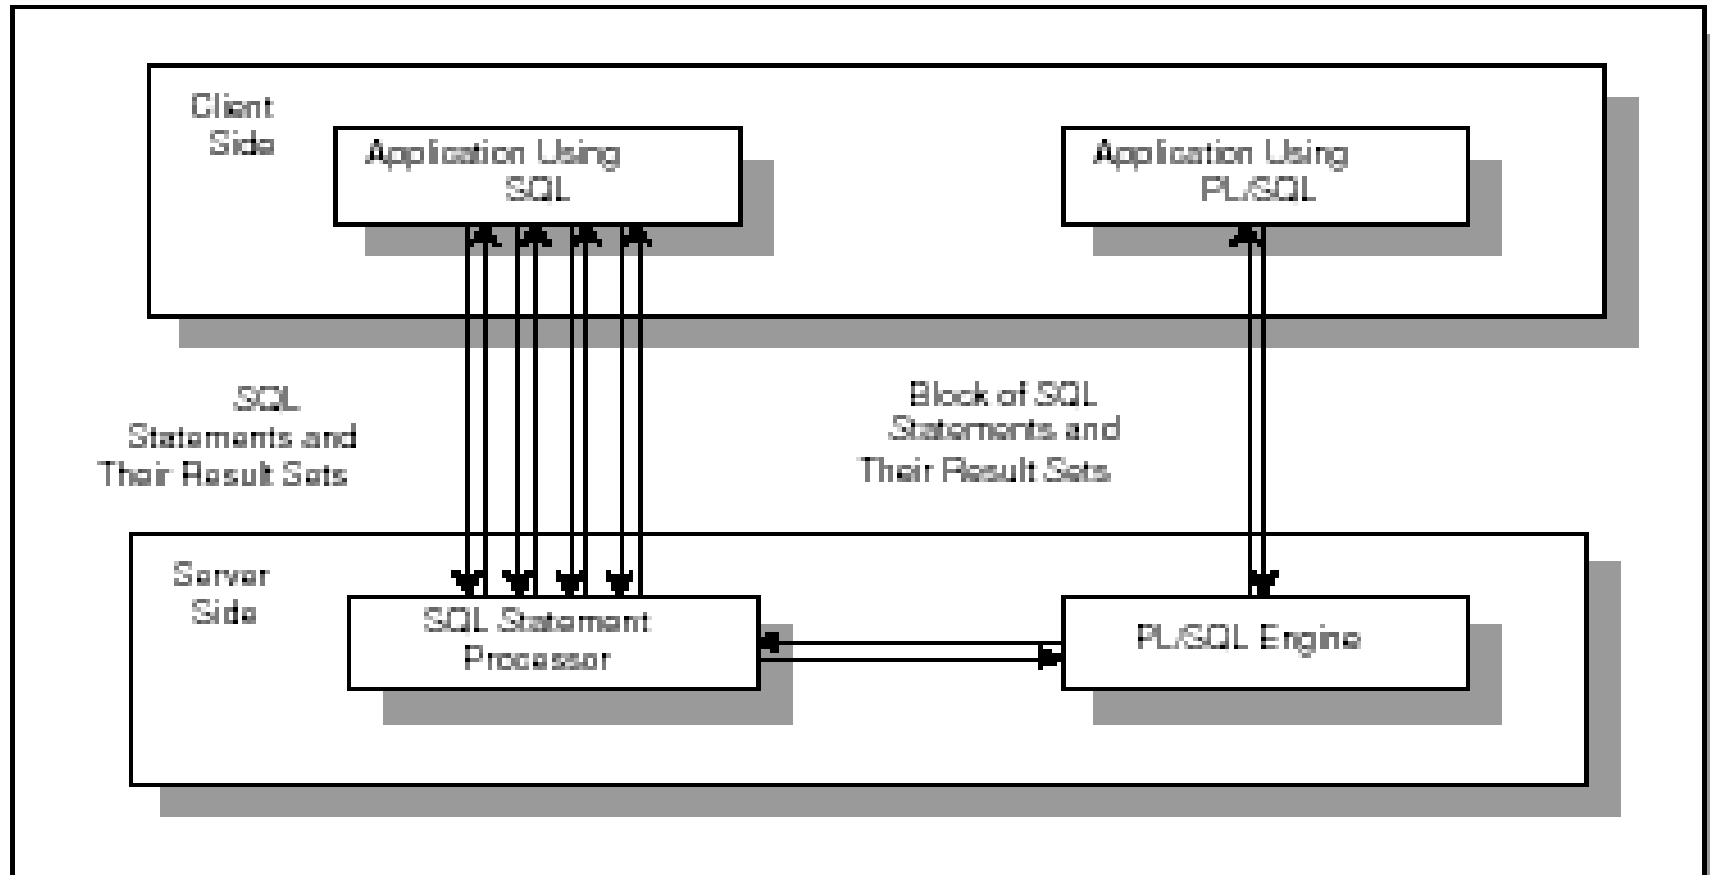

Figure 2.2 ■ PL/SQL in client-server architecture.

PL/SQL BLOCKS

- PL/SQL blocks can be divided into two groups:
 1. Named and
 2. Anonymous.
- Named blocks are used when creating subroutines. These subroutines are procedures, functions, and packages.
- The subroutines can be stored in the database and referenced by their names later on.
- In addition, subroutines can be defined within the anonymous PL/SQL block.
- Anonymous PL/SQL blocks do not have names. As a result, they cannot be stored in the database and referenced later.

PL/SQL BLOCK STRUCTURE

- PL/SQL blocks contain three sections
 1. Declare section
 2. Executable section and
 3. Exception-handling section.
- The executable section is the only mandatory section of the block.
- Both the declaration and exception-handling sections are optional.

PL/SQL BLOCK STRUCTURE

- PL/SQL block has the following structure:

DECLARE

Declaration statements

BEGIN

Executable statements

EXCETION

Exception-handling statements

END ;

DECLARATION SECTION

- The *declaration section* is the first section of the PL/SQL block.
- It contains definitions of PL/SQL identifiers such as variables, constants, cursors and so on.
- Example

DECLARE

 v__first__name VARCHAR2(35) ;

 v__last__name VARCHAR2(35) ;

 v__counter NUMBER := 0 ;

EXECUTABLE SECTION

- The executable section is the next section of the PL/SQL block.
- This section contains executable statements that allow you to manipulate the variables that have been declared in the declaration section.

BEGIN

SELECT first_name, last_name

INTO v_first_name, v_last_name

FROM student

WHERE student_id = 123 ;

DBMS_OUTPUT.PUT_LINE

('Student name :' || v_first_name || ' ' || v_last_name);

END;

EXCEPTION-HANDLING SECTION

- The *exception-handling section* is the last section of the PL/SQL block.
- This section contains statements that are executed when a runtime error occurs within a block.
- Runtime errors occur while the program is running and cannot be detected by the PL/SQL compiler.

EXCEPTION

```
    WHEN NO_DATA_FOUND THEN
        DBMS_OUTPUT.PUT_LINE
            (' There is no student with student id 123 ');
END;
```

HOW PL/SQL GETS EXECUTED

- Every time an anonymous block is executed, the code is sent to the PL/SQL engine on the server where it is compiled.
- The named PL/SQL block is compiled only at the time of its creation, or if it has been changed.
- The compilation process includes syntax checking, binding and p-code generation.
- Syntax checking involves checking PL/SQL code for syntax or compilation errors.
- Once the programmer corrects syntax errors, the compiler can assign a storage address to program variables that are used to hold data for Oracle. This process is called ***Binding***.

HOW PL/SQL GETS EXECUTED

- After binding, p-code is generated for the PL/SQL block.
- P-code is a list of instructions to the PL/SQL engine.
- For named blocks, p-code is stored in the database, and it is used the next time the program is executed.
- Once the process of compilation has completed successfully, the status for a named PL/SQL block is set to **VALID**, and also stored in the database.
- If the compilation process was not successful, the status for a named PL/SQL block is set to **INVALID**.

PL/SQL IN SQL*PLUS

- SQL*Plus is an interactive tool that allows you to type SQL or PL/SQL statements at the command prompt.
- These statements are then sent to the database. Once they are processed, the results are sent back from the database and displayed on the screen.
- There are some differences between entering SQL and PL/SQL statements.

SQL EXAMPLE

```
SELECT first_name, last_name  
FROM student;
```

- The semicolon terminates this SELECT statement. Therefore, as soon as you type semicolon and hit the ENTER key, the result set is displayed to you.

PL/SQL EXAMPLE

DECLARE

 v_first_name VARCHAR2(20);

 v_last_name VARCHAR2(25);

BEGIN

 SELECT first_name, last_name

 INTO v_first_name, v_last_name

 FROM employees

 WHERE EMPLOYEE_ID= 123;

 DBMS_OUTPUT.PUT_LINE

 ('Student name: '||v_first_name||' '||v_last_name);

EXCEPTION

 WHEN NO_DATA_FOUND THEN

 DBMS_OUTPUT.PUT_LINE

 ('There is no student with student id 123');

END;

PL/SQL EXAMPLE

- There are two additional lines at the end of the block containing “.” End “/”. The “.” marks the end of the PL/SQL block and is optional.
- The “/” executes the PL/SQL block and is required.
- When SQL*Plus reads SQL statement, it knows that the semicolon marks the end of the statement. Therefore, the statement is complete and can be sent to the database.
- When SQL*Plus reads a PL/SQL block, a semicolon
- marks the end of the individual statement within the block. In other words, it is not a block terminator.

PL/SQL EXAMPLE

- Therefore, SQL*Plus needs to know when the block has ended. As you have seen in the example, it can be done with period and forward slash.

EXECUTING PL/SQL

PL/SQL can be executed directly in SQL*Plus. A PL/SQL program is normally saved with an .sql extension. To execute an anonymous PL/SQL program, simply type the following command at the SQL prompt:

```
SQL> @DisplayAge
```

GENERATING OUTPUT

Like other programming languages, PL/SQL provides a procedure (i.e. PUT_LINE) to allow the user to display the output on the screen. For a user to be able to view a result on the screen, two steps are required.

First, before executing any PL/SQL program, type the following command at the SQL prompt (Note: you need to type in this command only once for every SQL*PLUS session):

```
SQL> SET SERVEROUTPUT ON;
```

or put the command at the beginning of the program, right before the declaration section.

GENERATING OUTPUT

Second, use **DBMS_OUTPUT.PUT_LINE** in your executable section to display any message you want to the screen.

Syntax for displaying a message:

DBMS_OUTPUT.PUT_LINE(<string>);

in which **PUT_LINE** is the procedure to generate the output on the screen, and **DBMS_OUTPUT** is the package to which the **PUT_LINE** belongs.

**DBMS_OUTPUT.PUT_LINE('My age is ' ||
num_age);**

SUBSTITUTION VARIABLES

- SQL*Plus allows a PL/SQL block to receive input information with the help of substitution variables.
- Substitution variables cannot be used to output the values because no memory is allocated for them.
- SQL*Plus will substitute a variable before the PL/SQL block is sent to the database.
- Substitution variables are usually prefixed by the ampersand(&) character or double ampersand (&&) character.

EXAMPLE

DECLARE

 v_student_id NUMBER := &sv_student_id;

 v_first_name VARCHAR2(20);

 v_last_name VARCHAR2(25);

BEGIN

 SELECT first_name, last_name

 INTO v_first_name, v_last_name

 FROM employees

 WHERE employee_id = v_student_id;

 DBMS_OUTPUT.PUT_LINE

 ('Student name: '||v_first_name||' '||v_last_name);

EXCEPTION

 WHEN NO_DATA_FOUND THEN

 DBMS_OUTPUT.PUT_LINE('There is no such student');

END;

EXAMPLE

- When this example is executed, the user is asked to provide a value for the student ID.
- The example shown above uses a single ampersand for the substitution variable.
- When a single ampersand is used throughout the PL/SQL block, the user is asked to provide a value for each occurrence of the substitution variable.

EXAMPLE

BEGIN

DBMS_OUTPUT.PUT_LINE('Today is '||&sv_day');

DBMS_OUTPUT.PUT_LINE('Tomorrow will be '|| &sv_day');

END;

This example produces the following output:

Enter value for sv_day: Monday

old 2: DBMS_OUTPUT.PUT_LINE('Today is '|| &sv_day');

new 2: DBMS_OUTPUT.PUT_LINE('Today is '|| Monday');

Enter value for sv_day: Tuesday

old 3: DBMS_OUTPUT.PUT_LINE('Tomorrow will be '|| &sv_day');

new 3: DBMS_OUTPUT.PUT_LINE('Tomorrow will be '|| Tuesday');

Today is Monday

Tomorrow will be Tuesday

PL/SQL procedure successfully completed.

EXAMPLE

- When a substitution variable is used in the script, the output produced by the program contains the statements that show how the substitution was done.
- If you do not want to see these lines displayed in the output produced by the script, use the SET command option before you run the script as shown below:

SET VERIFY OFF;

EXAMPLE

- Then, the output changes as shown below:

Enter value for sv_day: Monday

Enter value for sv_day: Tuesday

Today is Monday

Tomorrow will be Tuesday

PL/SQL procedure successfully completed.

- The substitution variable sv_day appears twice in this PL/SQL block. As a result, when this example is run, the user is asked twice to provide the value for the same variable.

EXAMPLE

BEGIN

```
DBMS_OUTPUT.PUT_LINE('Today is '||&&sv_day');
```

```
DBMS_OUTPUT.PUT_LINE('Tomorrow will be '||' &sv_day');
```

END;

- In this example, substitution variable sv_day is prefixed by double ampersand in the first DBMS_OUTPUT.PUT_LINE statement. As a result, this version of the example produces different output.

OUTPUT

Enter value for sv_day: Monday

old 2: DBMS_OUTPUT.PUT_LINE('Today is '|| '&&sv_day');

new 2: DBMS_OUTPUT.PUT_LINE('Today is '||' Monday');

old 3: DBMS_OUTPUT.PUT_LINE('Tomorrow will be '|| '&sv_day');

new 3: DBMS_OUTPUT.PUT_LINE('Tomorrow will be '||' Monday');

Today is Monday

Tomorrow will be Monday

PL/SQL procedure successfully completed.

- It is clear that the user is asked only once to provide the value for the substitution variable sv_day.
- As a result, both DBMS_OUTPUT.PUT_LINE statements use the value of Monday entered previously by the user.

Substitution Variables

- Ampersand(&) character and double ampersand (&&) characters are the default characters that denote substitution variables.
- There is a special SET command option available in SQL*Plus that allows to change the default character (&) to any other character or disable the substitution variable feature.
- This SET command has the following syntax:

SET DEFINE *character*

or

SET DEFINE ON

or

SET DEFINE OFF

Substitution Variables

- The first set command option changes the prefix of the substitution variable from an ampersand to another character. This character cannot be alphanumeric or white space.
- The second (ON option) and third (OFF option) control whether SQL*Plus will look for substitution variables or not.
- In addition, ON option changes the value of the *character* back to the ampersand.
