# Retrieving Data Using the SQL SELECT Statement

Oracle SQL Programming: Rebecca Gottlieb

#### **Lecture 1 Review**

- Start SQL\*Plus username? Schema?
- Executing a script in SQL\*Plus?
- login.sql script
- ABC Company Solution
- Primary Key
- Foreign Key
- Not Null value
- 1:1, 1:M, M:M
- Table Structure column data types

#### Capabilities of SQL SELECT Statements

#### **Basic SELECT Statement**

```
SELECT *|{[DISTINCT] column|expression [alias],...}
FROM table;
```

- SELECT identifies the columns to be displayed.
- FROM identifies the table containing those columns.

# **Selecting All Columns**

SELECT \* departments; FROM

|   | DEPARTMENT_ID | DEPARTMENT_NAME | MANAGER_ID | LOCATION_ID |
|---|---------------|-----------------|------------|-------------|
| 1 | 10            | Administration  | 200        | 1700        |
| 2 | 20            | Marketing       | 201        | 1800        |
| 3 | 50            | Shipping        | 124        | 1500        |
| 4 | 60            | IT              | 103        | 1400        |
| 5 | 80            | Sales           | 149        | 2500        |
| 6 | 90            | Executive       | 100        | 1700        |
| 7 | 110           | Accounting      | 205        | 1700        |
| 8 | 190           | Contracting     | (null)     | 1700        |

# **Selecting Specific Columns**

```
SELECT department_id, location_id FROM departments;
```

|   | DEPARTMENT_ID | LOCATION_ID |
|---|---------------|-------------|
| 1 | 10            | 1700        |
| 2 | 20            | 1800        |
| 3 | 50            | 1500        |
| 4 | 60            | 1400        |
| 5 | 80            | 2500        |
| 6 | 90            | 1700        |
| 7 | 110           | 1700        |
| 8 | 190           | 1700        |

#### Writing SQL Statements

- SQL statements are not case-sensitive.
- SQL statements can be entered on one or more lines.
- Keywords cannot be abbreviated or split across lines.
- Clauses are usually placed on separate lines.
- Indents are used to enhance readability.
- In SQL Developer, SQL statements can optionally be terminated by a semicolon (;). Semicolons are required when you execute multiple SQL statements.
- In SQL\*Plus, you are required to end each SQL statement with a semicolon (;).

### **Column Heading Defaults**

- SQL Developer:
  - Default heading alignment: Left-aligned
  - Default heading display: Uppercase
- SQL\*Plus:
  - Character and Date column headings are left-aligned.
  - Number column headings are right-aligned.
  - Default heading display: Uppercase

### **Arithmetic Expressions**

Create expressions with number and date data by using arithmetic operators.

| Operator | Description |  |
|----------|-------------|--|
| +        | Add         |  |
| 1        | Subtract    |  |
| *        | Multiply    |  |
| /        | Divide      |  |

### **Using Arithmetic Operators**

```
SELECT last_name, salary, salary + 300
FROM employees;
```

|    | LAST_NAME | SALARY | SALARY+300 |
|----|-----------|--------|------------|
| 1  | King      | 24000  | 24300      |
| 2  | Kochhar   | 17000  | 17300      |
| 3  | De Haan   | 17000  | 17300      |
| 4  | Hunold    | 9000   | 9300       |
| 5  | Ernst     | 6000   | 6300       |
| 6  | Lorentz   | 4200   | 4500       |
| 7  | Mourgos   | 5800   | 6100       |
| 8  | Rajs      | 3500   | 3800       |
| 9  | Davies    | 3100   | 3400       |
| 10 | Matos     | 2600   | 2900       |

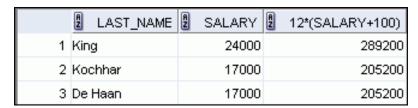

. . .

#### **Operator Precedence**

SELECT last\_name, salary, 12\*salary+100
FROM employees;

LAST\_NAME 2 SALARY 2 12\*SALARY+100
1 King 24000 288100
2 Kochhar 17000 204100
3 De Haan 17000 204100

SELECT last\_name, salary, 12\*(salary+100)
FROM employees;

- - -

. . .

#### **Defining a Null Value**

- Null is a value that is unavailable, unassigned, unknown, or inapplicable.
- Null is not the same as zero or a blank space.

last\_name, job\_id, salary, commission pct SELECT FROM employees; SALARY 2 LAST\_NAME JOB ID COMMISSION PCT 1 King AD\_PRES 24000 (null) 2 Kochhar AD\_VP 17000 (null) 12 Zlotkey 10500 SA\_MAN 0.2 13 Abel SA\_REP 0.3 11000 SA\_REP 0.2 14 Taylor 8600 . . . 19 Higgins AC\_MGR (null) 12000 AC ACCOUNT 20 Gietz 8300 (null)

# **Null Values in Arithmetic Expressions**

Arithmetic expressions containing a null value evaluate to null.

last name, 12\*salary\*commission pct SELECT **FROM** employees; LAST\_NAME 12\*SALARY\*COMMISSION\_PCT 1 King (null) 2 Kochhar (null) . . . 25200 12 Zlotkey 13 Abel 39600 20640 14 Taylor 19 Higgins (null)

(null)

20 Gietz

# **Defining a Column Alias**

#### A column alias:

- Renames a column heading
- Is useful with calculations
- Immediately follows the column name (There can also be the optional AS keyword between the column name and alias.)
- Requires double quotation marks if it contains spaces or special characters, or if it is case-sensitive

#### **Using Column Aliases**

```
SELECT last_name AS name, commission_pct comm FROM employees;
```

|   | NAME      |  | Ð | COMM |    |      |
|---|-----------|--|---|------|----|------|
| 1 | King      |  |   |      | (n | ull) |
| 2 | 2 Kochhar |  |   |      | (n | ull) |
| 3 | De Haan   |  |   |      | (n | ull) |

. . .

```
SELECT last_name "Name" , salary*12 "Annual Salary"
FROM employees;
```

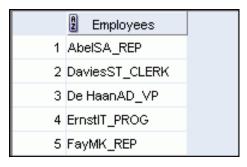

---

#### **Concatenation Operator**

#### A concatenation operator:

- Links columns or character strings to other columns
- Is represented by two vertical bars (||)
- Creates a resultant column that is a character expression

```
SELECT last_name||job_id AS "Employees"
FROM employees;
```

. . .

#### **Literal Character Strings**

- A literal is a character, a number, or a date that is included in the SELECT statement.
- Date and character literal values must be enclosed within single quotation marks.
- Each character string is output once for each row returned.

# **Using Literal Character Strings**

```
Employee Details

1 Abel is a SA_REP

2 Davies is a ST_CLERK

3 De Haan is a AD_VP

4 Ernst is a IT_PROG

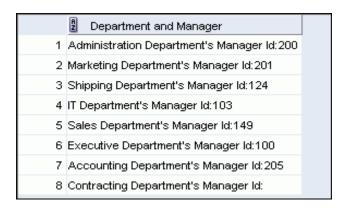

5 Fay is a MK_REP
```

. . .

```
18 Vargas is a ST_CLERK
19 Whalen is a AD_ASST
20 Zlotkey is a SA_MAN
```

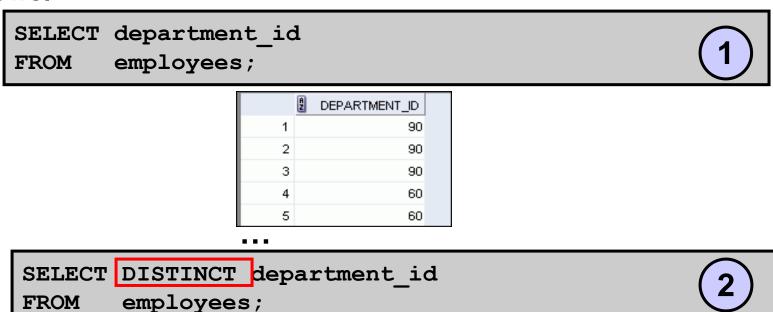

#### Alternative Quote (q) Operator

- Specify your own quotation mark delimiter.
- Select any delimiter.
- Increase readability and usability.

#### **Duplicate Rows**

The default display of queries is all rows, including duplicate rows.

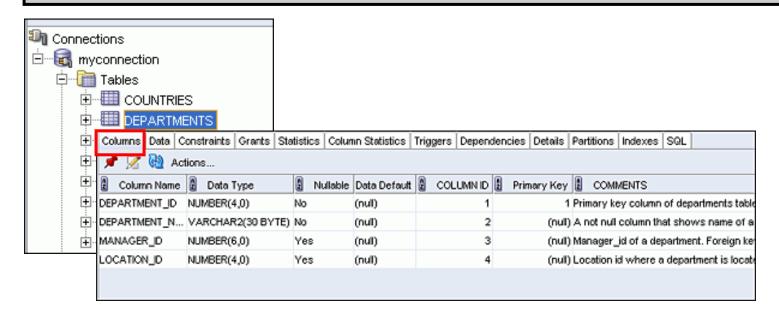

#### **Displaying the Table Structure**

- Use the DESCRIBE command to display the structure of a table.
- Or, select the table in the Connections tree and use the Columns tab to view the table structure.

#### DESC[RIBE] tablename

# Using the DESCRIBE Command

#### DESCRIBE employees

| DESCRIBE employees |          |               |
|--------------------|----------|---------------|
| Name               | Null     | Туре          |
|                    |          |               |
| EMPLOYEE_ID        | NOT NULL | NUMBER(6)     |
| FIRST_NAME         |          | VARCHAR2(20)  |
| LAST_NAME          | NOT NULL | VARCHAR2 (25) |
| EMAIL              | NOT NULL | VARCHAR2(25)  |
| PHONE_NUMBER       |          | VARCHAR2(20)  |
| HIRE_DATE          | NOT NULL | DATE          |
| JOB_ID             | NOT NULL | VARCHAR2(10)  |
| SALARY             |          | NUMBER(8,2)   |
| COMMISSION_PCT     |          | NUMBER(2,2)   |
| MANAGER_ID         |          | NUMBER(6)     |
| DEPARTMENT_ID      |          | NUMBER (4)    |
|                    |          |               |
| ll rows selected   |          |               |
|                    |          |               |

#### Quiz

Identify the SELECT statements that execute successfully.

```
SELECT first name, last name, job id, salary*12
    AS Yearly Sal
         employees;
   FROM
   SELECT first name, last name, job id, salary*12
    yearly sal
   FROM
          employees;
   SELECT first name, last name, job id, salary AS
3.
    yearly sal
          employees;
   FROM
   SELECT first name+last name AS name, job Id,
    salary*12 yearly sal
          employees;
   FROM
```

#### **Summary**

In this lesson, you should have learned how to:

- Write a SELECT statement that:
  - Returns all rows and columns from a table
  - Returns specified columns from a table
  - Uses column aliases to display more descriptive column headings

```
SELECT *|{[DISTINCT] column|expression [alias],...}
FROM table;
```
